```
The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cyrostatic and immunostimulant activity, and is useful as succine. The 121P2A3 proteins and polywucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cyrogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Challita-Bid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure
malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising a substance that modulates the status of 12192A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 12192A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mitchell SC;

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 12192A3. The composition of the modulates the status of a protein, 12192A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a concernation or cellular immune response. The polymucleotides are eliciting humoral or cellular immune response. The polymucleotides are objects as tools that can be used to delineate cytogenetic abnormalities of this chromosomal region that encodes 12192A3 that may contribute to in the chromosomal region that encodes 12192A3 that may contribute to malignant phenotype, and in assessing the status of 12192A3 gene products of mormal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 12192A3 or a particular structure agents or cellular that bind to 12192A3 or a particular structure concer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies to the management of cancer. The sequences shown in ABP83646 - ABP95595
                                                                                                                                                                                              ö
domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83646 - ABP95595
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition comprising a substance that modulates the status of 121P2A3 polypoptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymuclocides are useful for varcaterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83546 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 composition comprising a substance that modulates the status of 223 polypeptides, useful for eliciting humoral or cellular immune sonses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mitchell SC;

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for cliciting humoral or cellular immune response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal couseful for characterising cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP81646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           id PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimular activity, and is useful as a construction as a protein and polymucleotides are useful for calciting humoral or cellular immune response. The polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal construction as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for an incompact cancer vaccines that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                      Mitchell SC;

The invention relates to a novel composition comprising a substance that composition bas status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimmlant activity, and is useful as a constant of a proteins and polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal constant in the chromosomal region that encodes 121P2A3 that may contribute to in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for concerning and characterising domain-specific antibodies, for including agents or cellular factors that bind to 121P2A3 or a particular structure concern vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABPB3646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising a substance that modulates the status of 12192A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 12192A3 gene products in normal

modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel composition comprising a substance that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Challita-Eid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121PpA3. The composition of the modulates the status of a protein, 121PpA3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121PpA3 proteins and polymucleotides are useful for vaccine. The 121PpA3 proteins and polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121PpA3 that may contribute to malignant phenotype, and in assessing the status of 121PpA3 gene products in normal varsus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in maging methodologies for the management of cancer. The sequences shown in ABPB3646 - ABP95595 represent peptides from the 121PpA3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                             New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

```
The invention relates to a novel composition comprising a substance that modulates the status of a protein, 12192A3. The composition of the invention has eytostatic and immunostimulant activity, and is useful as a vaccine. The 12192A3 proteins and polymucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 12192A3 that may contribute to malignant phenotype, and in assessing the status of 1212P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 12192A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or cellular service are cancer vaccines. The antibodies or cellular service and in imaging methodologies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for the management of cancer. The sequences shown in ABP81646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                             New composition comprising a substance that modulates the status of 12,122A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                   Challita-Eid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

The invention relates to a novel composition comprising a substance that composition bas status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal composition cytogenetic abnormalities of this chromosomal region that encodes 121P2A3 that may contribute to in the chromosomal region that encodes 121P2A3 that may contribute to maignant phenotype, and in assessing the status of 121P2A3 gane products on normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies for identifying command and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies of T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies contexts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                     New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal versus cancerous tissues.
                                                                                                                                                                                                                  Mitchell SC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for varacterising cytogenetic abnormalities of this chromosomal conseful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83566 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                            New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for vaccine. The 121P2A3 proteins and polynucleotides are useful for calciting humoral or callular immune response. The polynucleotides are useful for characterising cytosenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                       New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

```

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has eytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are useful for caracterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies. for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal Challita-Bid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC; Afar DEH, Saffran D, Morrison K, Morrison RK, Ge W, Jakobovits A; Claim 13; Page 158; 362pp; English. versus cancerous tissues. New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal versus cancerous tissues.

Claim 13; Page 182; 362pp; English.

The invention relates to a novel composition compositing a substance that modulates the status of a protein, 121P2A3. The composition of the invention has eytostatic and immunostimmlant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for eliciting humoral or cellular immune response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immuniation, and in imaging methodologies. for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention

"Fur regulates the expression of iron-stress genes in the
"Fur regulates the expression of iron-stress genes in the
cyanobacterium Synechococcus sp. strain PCC 7942.";

Microbiology 142:1469-1476(1956).

-I-FUNCTION: ACTS AS A GLOBAL NEGATIVE CONTROLLING ELEMENT, EMPLOYING

-I-FE(2+) AS A COFACTOR TO BIND THE OPERATOR OF THE REPRESSED GENES

REGULATES GENES INVOLVED IN IRON SCAVENGING OR PHOTOSYNTHETIC

ELECTRON TRANSPORT.

-I- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-I- SIMILARITY: Belongs to the Fur family.

The present invention describes an isolated protein (1) serving as a receptor in plants for plant pathogen hypersensitive response elicitors. Also described: (1) an isolated nucleic acid encoding (1); (2) an antisense nucleic acid molecule to the nucleic acid of (1); (3) an expression vector containing the nucleic acid of (1) heterologous to the expression vector; (4) a transgenic host cell transformed with the nucleic acid of (1) or the DNA molecule of (2); (5) a transgenic plant transformed with the nucleic acid of (1) or the DNA molecule of (2); (6) identifying agents targeting plant cells, comprising forming a reaction mixture having (1) or the host cell of (4) and a candidate agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                Hypersensitive response elicitor receptor AtHrBPIp peptide SEQ ID NO:70.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated protein as a receptor in plants for plant pathogen hypersensitive response elicitors, useful for identifying agents that impart disease resistance, enhance plant growth, control insects and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptor; plant; plant pathogen hypersensitive response elicitor; hypersensitive response elicitor; disease resistance; enhancing plant growth; controlling insect; stress tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2

evaluating the reaction mixture for binding between (I) or the protein produced by the host cell and the candidate agent, and identifying candidate compounds which bind to the proteins in the reaction mixture as plant cell targeting agents; (7) enhancing plant receptivity to treatment with hypersenaitive response elicitors, comprising providing a transgenic with hypersensitive reansformed with the nucleic acid of (1); and (8) imparting disease resistance, enhancing growth, controlling insects, and/or imparting stress resistance, enhancing growth, controlling insects, and/or imparting stress resistance, enhancing growth, comprising providing a transgenic plant or plant seed transformed with a DNA construct effective to silence expression of a nucleic acid molecule of (1), or transformed with the nucleic acid molecule of (1). The methods and compositions of the invention are useful for identifying agents targeting plant cells to enhance a plant's receptivity to treatment with a hypersensitive response elicitor treatment includes imparting disease resistance, enhancing plant growth, controlling insects and/or imparting stress tolerance. The present sequence represents an Arabidopsis thaliana hypersensitive response elicitor receptor AthrBPIP Creptide, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       use in the composition of the invention. The composition comprises an immunogenic peptide of 9-10 residues with a supermotif which allows binding of more than one HLA molecule. It pref. comprises two conserved residues, a first at the 2nd position from the N- terminal is Pro, and a 2nd at the C-terminal is Met. These peptides are used to induce a CTL response in a patient. They are also useful in compositions for in vivo
                                                                                                                                       The present invention relates to novel peptide modulators of androgen receptor. The peptides of the invention are useful for treating androgen-sasociated disorders such as prostate cancer, particularly hormonally refractive prostate cancer, colon cancer, lung cancer, benign prostatic hypertrophy, acne, hirsutism, male pattern baldness, Stain-Leventhal epydrome, androgen insensitivity syndrome, infertility, endometrial cancer and X-linked spinal bulbar muscular atrophy. The present sequence is an androgen receptor binding peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptide; supermotif; HLA molecule; CTL response; therapeutic; cancer; viral infection; hepatitis B; hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compsn. comprising immunogenic peptide with supermotif allowing more than one HLA mol. to bind - used to induce CTL response in patient and for in vivo and ex vivo therapeutic and diagnostic applications.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a light chain complementarity determining region (CDR) from a tumour antigen specific antibody. The invention relates to a method for identifying a binding molecule having selective affinity for a ligand comprising: (a) selectively immobilising a diverse population of binding molecules to a solid support; (b) simultaneously contacting the diverse population immobilised on the solid support with 2 or more ligands; and (c) determining at least one binding molecule which selectively binds to one or more of the ligands. The method allows for the rapid and efficient methods for the identification of binding molecules which exhibit selective affinity for one or more ligands of molecules which exhibit selective affinity for one or more ligands of
  and ex vivo therapeutic and diagnostic applications, e.g the treatment of cancer and viral infections, e.g. hepatitis {\tt B} and {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying binding molecules for ligands, particularly tumour antigens -
by selectively immobilising a population of binding molecules to a solid
support and screening for binding to two or more ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    interest. They are used particularly for identifying tumour-specific binding polypeptides which can be used as targeting agents for cancer therapy that minimises impact on non-tumour tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour antigen; antibody; CDR; complementarity determining region;

The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a tetramer staining assay to assess peripheral blood monounclear cells for the presence of antigen-specific (TLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune reall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected from conserved regions of viral or tumour-associated antigens, which that may be present in whole antigens can be avoided with the use of the epitopes (CTL and HTL) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the epitopes that is safe and efficacious. Ababsa391 to Ababsa477 represent polypeptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                              An isolated human papilloma virus (HPV) epitope, useful in vaccines for treating HPV infections.

The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by estimulating the production of CTL or HTL responses, specifically in the creatment or prophylaxis of HPV infection, in persons who have not can also be used in a terramer staining assay to assess peripheral blood monouclear cells for the presence of antigen-specific CTLs following compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be present in whole antigens can be used nits and estrated antigens, which creduces the likelihood of escape mutants, also immunosuppressive epitopes for inclusion in an epitope-base vaccine may be resent in whole antigens can be avoided with the use of epitope base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the packing enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious. the present invention describes an isolated prepared number peritions (HPV) epitope (1). (1) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the production are useful for stimulating an immune response to HPV by present invention are useful for stimulating an immune response to HPV by estimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not treatment or prophylaxis of HPV infection, in persons who have not an alteramer staining assay to assess peripheral blood monouclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected from conserved regions of viral or tumour-associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive of that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine ceptopes achieving enhanced immunogenicity, the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a terramer staining assay to assess peripheral blood mononuclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  from conserved regions of viral or tumour associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the vaccine is that is safe and efficacious. AABS8391 to AABS847 represent polypeptide sequences used in the exemplification of the present
                                                                         Human papillomavirus; human leukocyte antigen; HLA; immune response; HPV; epitope; T cell; identification; vaccine; infection; genital wart; neoplastic growth; antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present invention describes an isolated prepared human papillomavirus \eta) epitope (I). (I) has antiviral activity, and can be used in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        An isolated human papilloma virus (HPV) epitope, useful in vaccines for
treating HPV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention describes MAGE2/3 epitopes (I). Also described are:

(I) a clonal cytocoxic T lymphocyte (CTL) that is cultured in vivo and
binds to a complex of (I); (2) a peptide (II) comprising (I) and a second
epitope and has less than 50 contiguous amino acids; (3) a vaccine
composition comprising (II), a unit dose of a peptide with at least 50
contiguous amino acids with 100% identity to the native peptide sequence
of MAGE2/3, and a pharmaceutical excipient; (4) an isolated nucleic acid
encoding (I); and (5) an isolated nucleic acid encoding (II). (I) has
cytostatic activity, and can be used in vaccines and as an
immunostimulant. A vaccine of (3) is useful for the treatment and
prevention of cancer. (I) is useful for monitoring or evaluating an
immunostimulant. A vaccine of (3) is useful for monitoring or evaluating an
immunostimulant. A vaccine of (3) is useful for monitoring or evaluating an
immunostimulant is necessary and a r-lymphocyte that binds to the
patient and detecting the presence of the T-lymphocyte that binds to the
cation allows the opportunity to combine epitopes derived
from multiple tumour-associated molecules reducing the likelihood of
tumour escape due to antigen loss. AAG84515 to AAG84199 and AAB99725

The sequences represent prostate cancer-associated antigens and derived motif or supermotif epitopes. The peptide epitopes are included in prostate cancer vaccine compositions due to their ability to bind to human leukocyte antigen (HLA) molecules, which recognise the motifs. Peptides with a high binding affinity are further tested for their ability to induce a cytotoxic T lymphocyte (CTL) or a helper T lymphocyte (HTL) response. Supermotif-bearing peptides may also be tested for their binding affinity to multiple alleles within the HLA superfamily. The vaccine compositions can be modified, for example, to enhance to enter the immunosuppressive groups, or to alter the immune response to suit the target disease. These groups or to alter the immune response to suit the target disease. These group-based vaccines allow the focus of an immune response to multiple selected antigens from the same pathogen. Variability among the immune responses of patients can therefore be alleviated by the inclusion of groups from multiple antigens in a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes isolated prepared HBR2/neu epitopes (1). Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is culture in vitro and binds to a complex of an epitope (TL), bound to a chuman leukocyte antigen (HLA) molecule; (2) a peptide (II) comprising (I) and a second epitope and the peptide is less than 50 contiguous amino composition (III) comprising (II) and a pharmaceutical composition (III) comprising (II) and a pharmaceutical composition (III) comprising (II) and a pharmaceutical correction is a usolated nucleic acid encoding a peptide comprising (I) and isolated nucleic acid encoding a peptide comprising (I) compution and treatment of cancer. (I) and (II) has cytostatic and immunostimulant activities, and can be used in vaccines (I). (II) and constitution and treatment of cancer. (I) and (II) are useful for inducing callular immune response for the computation or evaluating an immune response to a tumour associated antigen when incubated with a T lymphocyte sample form a patient and detecting the presence of bound T lymphocyte sample form a patient and detecting the presence of bound T lymphocyte to (I) or (II). Epitope based vaccines mean that immunosuppressive epitopes that may be combined to in whole antigens may be avoided. Selected epitopes may be combined to charactious agents or whole protein antigen is eliminated. The vaccine provides the objoility. The possible pathological side effects caused by infectious agents or whole protein antigen is eliminated. The vaccines provides the opportunity to combine epitopes darived from a lifely tumour associated molecules addressing the problem of tumour cumour variability and reducing the likelihood of tumour escape due to antigen loss. Ang88266 to AAG89121 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

particularly when compared to the use of whole antigens in vaccines, particularly when compared to the use of whole antigens in vaccines is directed largely toward variable response to whole antigens; is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (GTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABPI1501 to ABP25412.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines,

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequences (ABL2347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole catigues is directed largely toward variable response to whole altered is evidence that the immune response to whole catigues is directed largely toward variable response to whole altered is evidence that the immune response to whole altered is evidence may be selected from conserved regions of viral or an group-based vaccine may be selected from conserved regions of viral or thour associated antigens, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups (cTL and HTL), and firther, to modify the composition of the groups achieving, for example, enhanced is the ability to composition of the traditional approaches. Similar engineering of the response is not possible with traditional approaches. Application of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                                              Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

hereaffor immunising subjects against HTV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of secape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as immunogenicity. Accordingly, the immune response can be modulated, as immunogenicity. For the target disease. Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.

Example 1; Page 102; 448pp; English

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences ealected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of particularly when compared to the use of whole antigens in vaccines of particularly when compared to the use of whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The group for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine apprach is the ability to combine selected groups (CTL and HTL), and further, to modify the immunogenicity, Accordingly, the immune sesponse can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 invention
